                                                                                                                                                    Conley A., Urrutia R.;

"Isolation of a novel zinc finger transcription factor from the pancreas extends the repertoire of Spi-like proteins present in this organ (Abstract #153).";

Pancreas 21:437-437(2000).

-I- FUNCTION: Transcription factor that binds GC and GT boxes and displaces Spi and Sp3 from these sequences. Modulates dopaminergic transmission in the brain (By similarity).

-I- SUBCELDILAR LOCATION: Nuclear (By similarity).

-I- SUBCELDILAR LOCATION: Unclear (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   097279; 097356;

"The Sp11ike Protein BrEB3 inhibits transcription via the basic
transcription element box by interacting with mSin3A and HDAC-1
co-repressors and competing with Spl.";
J. Biol. Chem. 276:36749-36756(2001).
-! FUNCTION: Represses transcription by binding to the BTE site, a
GC-rich DNA element, in competition with the activator SPl. It
also represses transcription by interacting with the co-repressor
Sin3A and HDAC1. Activates RANTES expression in T cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PROSITE; PS00028; ZINC_FINGER_C2H2_1; 3.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                         The specification describes a method for identifying genes associated with a selected phenotype. The method involves providing a library of nucleotide sequences encoding partially randomized zinc finger proteins, transducing cells with expression vectors, each comprising a sequence from the library, culturing the cells for expressing the zinc finger protein, assaying the cells for selected phenotype, and identifying the gene of interest, in cells exhibiting the phenotype. The method is useful for identifying a gene or genes associated with a selected phenotype such hematopolesis, osteoporosis, obesity, cardiovascular disease or diabetes. The method is useful in academic laboratories in the biotechnological industries, and in pharmaceutical, genomic, agricultural and chemical companies. AbB&433.44 represent recognition helices of zinc finger proteins, which recognise different DNA triplets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a modified plant zinc finger protein. This zinc finger protein is used to modulated gene expression in a plant cell. Nucleic acid encoding the zinc finger is expressed in plant cells to produce a plant with an altered phenotype relative to the wild-type plant. The altered phenotype is high in nutritional value, yield, stress tolerance, pathogen resistance, resistance to agrochemicals, production of pharmaceutical compounds or production of industrial chemicals. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischaemia, arthitis, wounds, ulcers, tumours, diabetic retinopathy or psorlasis. The present sequence is a peptide shown in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a zinc finger protein that binds to a target site in one or more vasular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating anglogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                endothelial growth factor gene, useful for modulating expression of gene and for treating atherosclerosis, ischemia, arthritis, wound or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VBGF) genes. The protein is useful for modulating expression of a VBGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression of the gene and for treating atherosclerosis, ischemia, arthritis, wound or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endochelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atheroscierosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression of the gene and for treating atherosclerosis, ischemia, arthritis, wound or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothellal growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating anglogenesis and vasculogenesis. This can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Zinc finger protein; anglogenesis; vasculogenesis; ischaemia; diabetic retinopathy; psoriasis; arthropathy; cancer; tumour growth; gene therapy; antiatherosclerotic; vasotropic; antiarthritic; vulnerai antiulcer; cytostatic; antipsoriatic; antidiabetic; ophthalmological; osteopathic; antiinfertility.
                    New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression cgene and for treating atherosclerosis, ischemia, arthritis, wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human VEGF-targeted zinc finger protein fragment SEQ ID NO: 134
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Eisenberg SP;

                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression of the gene and for treating atherosclerosis, ischemia, arthritis, wound or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention.
                                                                                                                                                                                                                                                                                                                                               Human VEGF-targeted zinc finger protein fragment SEQ ID NO: 170.
                                                                                                                                                                                                                                                                                                                                                                                                           protein; angiogenesis; vasculogenesis; ischaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 1; Page 104; 195pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression of the gene and for treating atherosclerosis, ischemia, arthritis, wound or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, isohemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide
treat atherosclerosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psorlasis. The present sequence is a peptide shown in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                            of the
                                                                                                                                                                                                                                                                                                                                      The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosociarosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention.
        Zinc finger protein; angiogenesis; vasculogenesis; ischaemia; diabetic retinopathy; psoriasis; arthropathy; cancer; tumour growth; gene therapy; antiatherosclerotic; vasotropic; antiatheritic; vulnera antiulcer; cytostatic; antipsoriatic; antidiabetic; ophthalmological;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                 New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression ogene and for treating atherosclerosis, ischemia, arthritis, wound

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischemia, arthritis, wounds, uicers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to regulating the expression of a gene residing in the chromatin of a cell. The method involves identifying one or more accessible regions in cellular chromatin associated with gene; designing a regulatory molecule comprises a DNA-conditional domain targeted to a sequence within the accessible region, and functional domain targeted to a sequence within the accessible region, and contacting the regulatory molecule with the cell.

The method is used for regulating the expression of a gene (e.g., a gene cancoding a nuclear receptor such as estrogen receptor alpha (ERRalpha), consolidating the expression of a gene (e.g., a gene catrogen receptor beta (ERbeta), hepatocyte nuclear factor 4 alpha (ERRalpha), constitutively active receptor alpha (ERRalpha), residing in the chromatin of a cell. Regulation of gene expression (such as nuclear receptor genes) will be useful in treatment of various cas nuclear receptor genes) will be useful in treatment of various cas nuclear receptor genes) will be useful in treatment of various carry out the regulation. The method is also useful for modulation of gene expression for therapeutic or prophylactic applications e.g., carry out the regulation. The method is also useful for modulation of disease, stroke, etc. The method also has applications in pharmaceutical arthritis, psoriasis, HIV infection, sickle cell anemia, Alzheimer's cunknown function. The method also facilitates development of tissue and cardinal models of disease states, duny validation, and therapeutic product development. The method also facilitates development of tissue and cardinal models of disease states, duny validation, and therapeutic product development. The method also allow identification of cardinal models of disease states, duny validation, and therapeutic product development. The method also allow identification of cardinal models of disease states, duny validation, and therapeutic product development.

regulating expression of gene by contacting cell with regulatory molecule comprising DNA-binding domain targeted to sequence within accessible region of cellular chromatin associated with a gene, and functional domain

Example 1; Page 44; 64pp; English.

The invention relates to regulating the expression of a gene residing in the chromatin of a cell. The method involves identifying one or more accessible regions in cellular chromatin associated with gene; designing a regulatory molecule comprises a DNA-binding domain targeted to a sequence within the accessible region, and a functional domain; and contacting the regulatory molecule with the cell. The method is used for regulating the expression of a gene (e.g., a gene entrogen receptor beta (ERMetal, hepatocyte nuclear factor 4 alpha (FRRalpha), hepatocyte nuclear factor 4 alpha (FRRalpha), or constitutively active receptor alpha (ERMalpha)) residing in the chromatin of a cell. Regulation of gene expression (such as nuclear receptor genes) will be useful in treatment of various classases, including cancer, diabetes and cardiovascular disease, where the regulatory molecule as described above, is contacted with the cell to denote the regulation of the repulation of penespination of gene expression of carry out the regulation of the repulation of penespination of gene expression of such carry out the regulation of penespination of penespination of gene expression of carry out the regulation of penespination of gene expression of gene expression for the required view method is also useful for modulation of gene expression of gene expression for the required view of the regulation of the repulation of the repulation of the regulation unknown function. The method also facilitates development of tissue and animal models of disease states, drug validation, and therapeutic product development. The methods also allow identification of the role of nuclear receptors of unknown functions in cellular homeostasis. Sequences ABB6071-817 represent zinc finger protein (ZFP) DNA-binding domains that were fused to functional domains and tested for their ability to regulate expression of the ER in living cells. diabetic retinopathy, ischaemia, macular degeneration, rheumatoid arthritis, psoriasis, HIV infection, sickle cell anemia, Alzhaimer's disease, stroke, etc. The method also has applications in pharmaceutical research of both nuclear receptors of known function as well as those of

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) of a target site, comprising a first (FI), a second (F2), and a third (F3) of target site comprises, in 3'-5' direction, a first (SI), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and (I) designing (I); (2) a polynucleotide (III) encoding (I) or (II); and (I) fings to the S1 target subsite, selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc that it binds to the S2 target subsite, thus designing (I) that it binds to the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites having the nucleotide G in the 5'-most position of the subsite. (I) is useful in studying gene function, and for human therefore and plant engineering. (I), (II) or (III) is useful in the subsite; therapeutic methods to modulate the expression of a target region within the subsite; and function of gene expression of a target region within a subject, in diagnostic methods for sequence specific detection of target uncleic acid in a sample, and in assays to determined the compoundation of gene expression. (I) has improved affinity and specificity for their target sequences, as well as enhanced the form of the factor of the subsite of the factor of the factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               epresent DNA target sequences and zinc finger peptides which are given
                                                                                                                                                                                                                                                                        New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 1; Page 37; 81pp; English
